Box Code Sample Instructions

BoxCodeSamples provides model and network code that makes it easy to use the Box API methods for Login, Registration, GetAccountTree, Share and Upload.

The project is split up into two logical folders 'Models' and 'Model Builders.' 'Models' contains BoxUserModel, which stores data about a user's session, BoxObjectModel which describes basic information common to both Folders and Files and BoxFileModel and BoxFolderModel which are both subclasses of BoxObjectModel and describe additional information specific to Files and Folders respectively.

The objects in the 'Model Builders' logical folder make it easy to request information from the server. In general each Model has it's own ModelBuilder which takes information necessary for the call and allocs and autoreleases a Model object populated with information from the server. See the specific docs for more information on what information each call needs.
